

Homework 1

1 Objectives:

- Create a new github repository under your github account using [ecp8506-template](#) as a template repository.
- Perform `git clone` to clone the repository to your local MSI disk.
- Create a new file in your local repository, then perform `git add`, `git commit` and `git push` to add the new file to your remote github repository.

1.1 Create a new github repository

- Navigate your browser to [ecp8506-template](#) github repository. Click **Use this template** on the top right corner.

- Name the repository as `ecp8506-your_x500`, make sure the owner is your github account, then click the button to create repository.

Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere? [Import a repository](#).

Required fields are marked with an asterisk (*).

Repository template

 UMN-ECP-PMX/ecp8506-template ▾

Start your repository with a template repository's contents.

☐ **Include all branches**

Copy all branches from UMN-ECP-PMX/ecp8506-template and not just the default branch.

Owner *

 chengshen1992 ▾

Repository name *

/ ecp8506-cheng423

✔ ecp8506-cheng423 is available.

Great repository names are short and memorable. Need inspiration? How about [literate-octo-guacamole](#) ?

Description (optional)

☒  **Public**

Anyone on the internet can see this repository. You choose who can commit.

☐  **Private**

You choose who can see and commit to this repository.

 You are creating a public repository in your personal account.

Create repository

1.2 Clone the repository to local

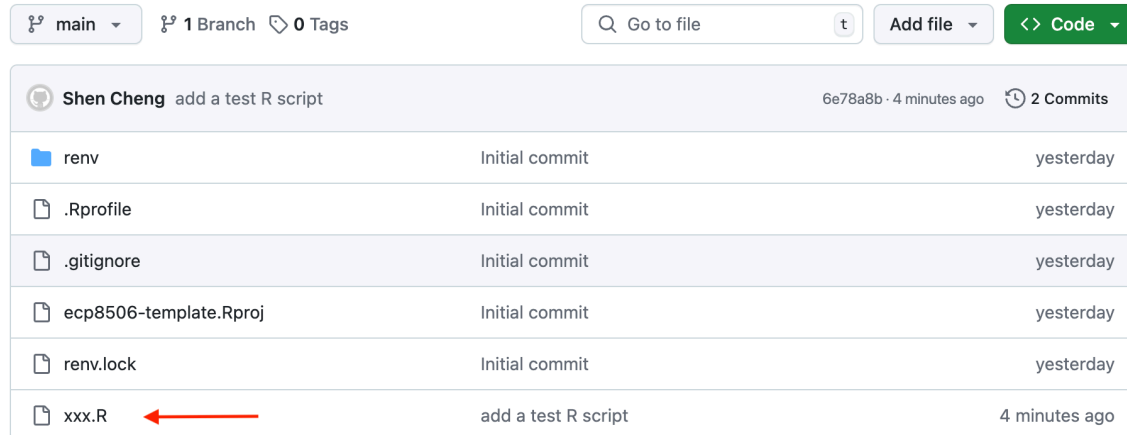

- Start a new Rstudio Server session on MSI.
- Use RStudio IDE functionality to start a project using Version Control or in terminal, perform `git clone` to clone the repository to local MSI disk.
- Open the R project file (`.rproj`) file in the local repository.
- Run `renv::restore()` to restore the installation of all the R packages. This step might take quite a few minutes to complete.

1.3 Create a new file in the local repository and add it to the remote repository

- Create a new R script in the local repository, names it as you like, for example `xxx.R`
- Use RStudio IDE functionality to add, commit and push the new file to the remote repository.
- If you are using terminal:
 - In terminal, run `git add xxx.R`.
 - In terminal, run `git commit -m "add a test R script"`. Here, `-m` means leave a message with the text inside the “ ” as the message contents.
 - In terminal, run `git push`. If you see the output looks like this, your have successfully added the new file in your remote github repository.

```
